2 INSTALLATION

2.12 Allowance for Expansion

Allowances must be made for the system to expand as detailed in the Heater Expansion Chart on this page. The supplied stainless-steel, flexible gas connector is recommended. If, however, local codes require rigid piping to the heater, a swing joint can be used.

| | | HEATER EXPAN | NSION CHART | | | | | | |
|--------|--|---------------------------------|----------------------------------|---------------------------------------|--|--|--|--|--|
| | Exchanger length and gas input will determine overall expansion. Heaters in a typical installation will expand towards both the burner and | | | | | | | | |
| | | | ers in a typical installation wi | ll expand towards both the burner and | | | | | |
| | | ble gas connector installation. | | | | | | | |

2 INSTALLATION

2.13 Electrical Requirements

- 1. Heaters operate on 120 volts, 60 Hz, single phase. The maximum amperage requirement (starting current) is 4.8 amps per heater. The running current is 1.1 amps.
- 2. Heater must be grounded in accordance with the Canadian Electrical Code C22.1 (latest edition).
- 3. Wiring must not be exposed to direct radiant output.

- 4. Observe proper electrical polarity.
- 5. It is recommended that the thermostat be installed on the hot side of a fused supply line and have sufficient ampere rating for the heater(s) it controls.

2.14 Lighting Instructions

- 1. Purge main gas supply line at start-up.
- 2. Rotate heater's manual gas valve knob to the "ON" position.
- 3. Close electrical circuit.
- 4. If heater fails to light, turn off gas and wait five minutes before repeating the above procedure.

2.15 Shutdown Instructions

- 1. Open electrical circuit.
- 2. Rotate heater's manual gas valve knob to the "OFF" position.

Instructions pour l'allumage

- 1. Purger la conduite d'alimentation en gaz principale.
- 2. Tourner le bouton du robinet de gaz a commande manuelle jusqu'a ce qu'il se trouve en position de marche ("ON").
- 3. Fermer le circuit electrique.
- 4. Si l'appareil de chauffage ne s'allume pas, attendre 5 minutes avant de suivre de nouveau les instructions ci-dessus.

Pour eteindre l'appareil

- 1. Ouvrir le circuit electrique.
- 2. Tourner le bouton du robinet de gaz a commande manuelle de l'appareil de chauffage jusqu'a ce qu'il se trouve en position d'arret ("OFF").

3 THEORY OF OPERATION

3.1 CX Models

STARTING CIRCUIT (FIGURES 3.1.1 & 3.1.2) When voltage is applied to L1 and L2, a circuit is completed from L1 via the blower motor to L2. The blower fan is mounted in the control box and rated to supply sufficient air for combustion.

Air pressure generated by the blower will cause the normally open burner pressure switch No.1 to close. Another circuit is completed from L1 to the hot surface ignition control and back to L2. There is a five-second delay, then the glo-bar is powered. After the glo-bar has been powered for 45 seconds, the control causes the gas valve to open and initiates the

Ignition trial. Power to the glo-bar is shut off during the last two or three seconds of ignition trial.

RUNNING CIRCUIT

After ignition the flame rod monitors the main burner flame. As long as a flame is present, the valve is held open. If the flame is lost, the control acts to close the valve within one second, and a new trial sequence identical to that at start-up is initiated. If proof of flame is not established within 8.5 seconds, the unit will lock out. If lockout occurs, the control can be reset by briefly interrupting the power source.

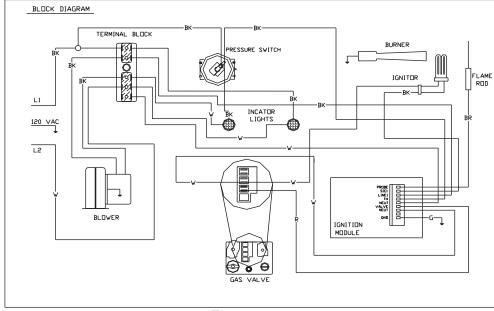

Figure 3.1.2

4 SERVICE

4.1 Maintenance

The gas fired infra-red heaters require a minimum of routine maintenance to keep them operating at peak performance.

- 1. Prior to the heating season heater operation must be verified by qualified service personnel.
- 2. Ensure that the blower impeller is kept clean. If dirt becomes a problem, installation of outside air intake ducts for combustion is recommended. Oiling the blower motor will extend bearing life beyond the 30,000 hour minimum.
- 3. Keep the aluminum reflectors from accumulating deposited material.

WARNING

Use protective glasses when cleaning the heater.

- 4.2 Gas Valve Testing
- 1. Disconnect the heaters power supply.
- 2. Disconnect all the wires from the valves terminals.

When testing the valves resistance they should read as follows:

Main (M) to Common (C) 355

Common (C) to Redundant (P) 1.89K

4.3 GENERAL TROUBLE SHOOTING

| SYMPTOM | POSSIBLE CAUSE | CORRECTIVE ACTION |
|---|--|--|
| Thermostat closed NO FAN | Blown fuse. Faulty thermostat. Disconnected wire. Faulty fan. | Replace. Replace. Repair. Replace. |
| Fan Operates - NO INDICATOR LIGHTS - NO HEATER OPERATION | Blocked air intake. Burner switch wire disconnected. Burner switch faulty. Burner switch sensing tubes plugged. Control box lid loose or leaking. | Remove all foreign matter in intake air stream. Repair. Replace. Remove clean and install. Secure or reseal. |
| Fan Operates Burner Switch Light Operates - NO EXHAUST SWITCH LIGHT - NO HEATER OPERATION | Exhaust vent blocked. Exhaust switch wire disconnected. Exhaust switch faulty. Excessive wind pressure on vent cap. Wrong baffle installed. | Remove all foreign matter in vent. Repair. Replace. Verify cap, extend or relocate. (See Flue Venting 2.8) Consult tube assembly baffle chart for proper lengths. (See page 14) |
| Fan Operates Indicator Lights Operates - NO GLOBAR | Glo-bar broken. Circuit board faulty. Wiring harness disconnected. | Replace. Replace. Reconnect or replace. |
| Indicator Lights Operate Glo-Bar Operates - NO GAS VALVE | Circuit board faulty. Gas valve faulty. Wire disconnected. | Replace. Replace. Reconnect. |
| Glo-Bar Operates Gas Valve Operates - NO IGNITION | Blocked gas orifice. Low gas pressure. Low glo-bar surface temperature. | Remove & clean. Provide required gas pressure. Replace-ensure a clean air supply. |
| Gas Valve Operates Ignition Occurs - HEATER CYCLES OFF - GOES INTO LOCKOUT | Flame sensor faulty. Heater not grounded. Electrical supply service panel not grounded. Gas valve faulty. Circuit board faulty. Electrical polarity incorrect. | Replace. Locate and repair. Locate and repair. Replace. Replace. Reconnect. |
| Heater Operating - TUBE BOWING | Insufficient combustion air. Overfired. Ensure exchangers have room to expand. Heater not supported properly. Reflectors not positioned properly. Baffle installed wrong. | Check intake duct for blockage and sizing. Check gas pressure. Re-install vent connection. Re-position hangers or chains. Re-position. Re-position. |
| Heater Operating - VENT CONDENSING | Stack length too long. Light gauge flue pipe used. Uninsulated vent pipe running through cold space. Negative pressure in building. Common vented heaters installed with individual thermostats. | Shorten stack. Minimum 26 Ga. Required. Insulate vent. Install combustion air intake. Install one thermostat. |
| Odor or fumes in space. | Vaporized solvents decomposing when contacting radiant tubes. Lift trucks. Loose tube connections. | Install exhaust fan at ceiling. Install exhaust fan and repair. Tighten to 50-60 lbft. |
